

FILTERS FOR STERILE AIR, STEAM AND LIQUIDS

Solutions for sterile Requirements

Donaldson - Global Partner for sterile Requirements

Donaldson is a leading global manufacturer of filtration systems. The company, founded in 1915, is strongly technology-oriented and has set itself the goal of implementing the needs of global customers

High-quality filter housings

for filtration solutions through innovative research and development. The application-oriented knowhow of Donaldson relies on the global presence and the knowledge of more than 10,000 employees in more than 100 offices and manufacturing facilities.

Reliable Process Solutions

Donaldson offers a complete filtration portfolio of innovative solutions for air & gas, steam and liquids. All products are designed to reach maximum purity standards and fulfil highest quality requirements.

Reliable Product Quality

All filter elements are produced, packaged and shipped under strict controls in an exact manner and meet the quality and performance data that are stored in the product specification.

Economical Solutions in Sanitary Quality

Air and Gas Filter Housings

High Quality Stainless Steel Housings in Sanitary Quality

PG-EG stainless steel housings are used for the purification of compressed air and other technical gases. Combined with the different filter elements they provide an optimised solution

for nearly any application. The standard model series PG-EG (Single and Multiple) each consists of six different housing sizes for operating flow rates of 7.5 m³/h to 270 m³/h and for operating flow rates of 540 m³/h to 2,700 m³/h (at 1 bar absolute).

Technical Data PG-EG Housings

Donaldson PG-EG sanitary filter housings (Single, clamp connection) are 3-A certified as standard.

Sterile Filtration of Air and Gases

Air and Gas Filter Elements

Sterile Filter (P)-SRF C/V/X

The new (P)-SRF filter in the versions C (=Compressed Air), V (=Venting), and X (=Extreme) is mainly used for safe sterile air and gas filtration. The sterile filters meet the high demands of the food and beverage industry as well as the pharmaceutical industry and works reliably even under extreme operating conditions. High filtration rates, e.g. for bacteria, viruses, and particles of down to 3 nm, increase product and process integrity. The sturdy construction of the filter with its stainless steel liners allows for a high number of steam sterilization cycles as well as for sterilization processes, using VPHP and ozone. It is ideal for fermentation applications.

Temperature resistance and mechanical stability ensure a high degree of operational safety, reducing the total cost of ownership. This helps to avoid production downtimes and reduces maintenance costs.

Outstanding Features

- High filtration rate:
- LRV for bacteria and MS2 coliphagae up to > 9, for nano-scaled particles up to > 10
- Suitable for sterilization, using hydrogen peroxide (VPHP) and ozone
- Low differential pressure at high flow rates
- Filter elements are reverse-flow sterilizable
- For indirect food contact according to CFR Title 21 & 1935/2004/EC
- Excellent dewetting characteristics
- Mechanical stability for high operational safety

Steam Sterilisation Instructions for Air Filters

Work Flow: Sterilisation Instructions for Air Filter in Flow Direction

(1) Open valves V4, V5, V6, and V7.

(2) Open valve V1 and allow the steam condensate to drain until the steam trap below valve V3 closes. (3) Slowly open V3 allowing steam into the system: this will flow across the filters and through valve V4 and V5. This will allow the heating of the housing, the filters and associated piping without generating a significant differential pressure across the filters. (4) When 'live' steam flows from valve V5, close valve V5. This will direct the steam through the heated filter.

(5) Observe the pressure gauges P1 and P2, control the steam flow rate at valve V3 and set the sterilisation steam pressure to approx. 300 mbar above the required saturated steam pressure (P1). (6) Ensure the differential pressure across the filter does not exceed 0.2 to 0.3 bar g.

(7) When the steam trap below valve V6 closes, the steam pressure will begin to rise.

See our sterilisation guide for additional information!

(8) Ensure the steam pressure/temperature does not exceed the maximum allowable pressure/temperature for the cartridge type being steamed. If reading from pressure gauges it is recommended the maximum steam pressure is 3.0 bar g in the forward direction.

(9) Steam sterilise the cartridges for the time specified ensuring the conditions stated in steps 5 to 7 are followed.

(10) On completion of the Sterilisation-In-Place (SIP) cycle, close V4, V6, V3 and V1 in that order.

(11) Fully open V5 to flash-dry the filter (or step 12). (12) Open V2 to allow compressed air into the system. The air pressure should be no more than 0.5 bar g above the steam pressure.

(13) Allow the system to cool for 15 minutes, then close V5 (flash-dry only).

Steam Sterilisation Instructions for Air Filters

Work Flow: Sterilisation Instructions for Air Filters in Reverse Direction

(1) Open valves V4, V5 and V6.

(2) Open valve V1 and allow the steam condensate to drain until the steam trap below valve V2 closes.
(3) Slowly open V2 allowing steam into the system.
(4) Observe the pressure gauges P1 and P2 and control the steam flow rate at valve V2 to ensure the differential pressure across the filter does not exceed 0.1 bar g*. If it exceeds 100 mbar stop the sterilisation procedure and rectify the cause of the differential pressure before proceeding with the sterilisation routine.

(5) When 'live' steam flows from valve V6, close valve V6. When the steam trap below valve V5 closes, the steam pressure will begin to rise.
(6) Ensure steam pressure/temperature does not exceed the maximum allowable pressure/temperature for the cartridge type being steamed. Continue to monitor the differential pressure using gauges P1 and P2. If it exceeds 100 mbar stop the sterilisation procedure.

(7) On completion of the sterilisation cycle time, close V4, V2, V1 in that order.

(8) Rapidly open V6 to flash dry the filter (or step 9).(9) Open V7 slowly to allow air into the system. The pressure of the air should be no more than 0.5 bar g above the steam pressure.

(10) Allow the system to cool for 15 minutes then close V6 (flash-dry only).

Comments for Sterilisation Instructions for Air Filters:

A double downstream valve is recommended so that under the cartridge steaming protocol the valves sealing faces of V7 can be effectively sterilised. The sealing valve faces of V8 can be similarly sterilised when the tank is steamed. When steam sterilizing the tank, V7 would be closed and V6 and V8 open. Normally the tank would be steamed separately before steaming the filter. If the filter is steamed before steaming the tank it is recommended that valve V7 is closed in the post Sterilisation-In-Place settings to maintain sterility. The valve V7 must be closed during Step 9. Valve V7 should be installed horizontally and valve V6 / steam trap installed immediately downstream of V7. All drains should be fitted vertically to allow liquid removal.

Steam Filter Housings

High-quality Stainless Steel Housings in Industrial Quality

Together with the (P)-GS VE and the (P)-GSL N filter elements, the Donaldson P-EG filter housings are used in a variety of steam filtration applications. Equipped with a variety of connections,

P-EG housing

Technical Data P-EG Housings

the P-EG housings are designed for low differential pressures and high flow rates.

Steam Filtration with high Flow Rates

Steam Filter Elements

Steam Filter (P)-GSL N

The (P)-GSL N filter element removes contaminants such as particles, abrasion of valve, seatings and seals as well as rust. An improved steam quality ensures longer service life of the filters to be sterilised and therefore increases the efficiency of the entire process. In addition, the (P)-GSL N filter element is a particularly efficient filtration product since the filter medium can be regenerated by ultrasonic bath or by back washing. This is especially important where there is a particularly high particle load. The pleated stainless steel filter media provides high particle or dirt-holding capacity and a high flow rate at low differential pressures.

Outstanding Features

- High dirt-holding capacity at a low differential pressure and a high flow rate
- Can be regenerated by back washing and ultrasonication
- Retention rate > 99.996 at 0.01 µm
- Suitable for temperatures from -20 °C up to +200 °C
- \bullet Also available as 5 μm grade for culinary steam
- Suitable for food contact use according to CFR Title 21 & 1935/2004/EC

General Guidelines for the Design of Steam Filtration Installations

The type of the steam filter and the retention rate to be selected depends on the quality of the steam which is required for the specific application. To prevent rapid clogging of the steam filter, it is important to consider the particle load in the pipes. This may require the use of pre- and fine filters.

In addition, the flow rate of the steam in an installation should not exceed 25 m/s. In special circumstances, velocities up to 40 m/s are okay, but the resulting turbulent currents and higher differential pressures must be taken into account.

The differential pressure in a new steam filter installation should be within a range of 0.1 bar to 0.3 bar. Higher temperatures (> 150 °C) require special higher temperature O-rings.

Choice of Steam Filters

(1) Recommendations Installation

- The flow through the membrane filter during the steam sterilisation may only occur from the upstream side (see figure on page 8).
- In a steam sterilisation, the flow through a sterile depth filter is possible from the upstream as well as in the reverse process (see figure on page 9).
- The pressure difference between the filter inlet and outlet should not exceed 0.3 bar g (pressure gauge reading). The steam flow rate in the filter element must be limited to a minimum value. The temperature and differential pressure during sterilisation must be measured and controlled.
- A vent valve must be mounted at the top of the housing, since the system must be vented prior to sterilisation. Residual air trapped in the system causes a decrease in temperature in the filter housing, which can prevent a complete destruction of micro-organisms.

(2) Steam Pretreatment Recommendations

- Vapour filters protect the sterile filter efficiently against damage e.g. corrosion particles.
- Filtered boiler feed water is a prerequisite for particle-free steam.
- The steam generator must be serviced regularly. The systems (pipelines, etc.) should preferably made of stainless steel.

At a vapour velocity of 20 m/sec in the pipe, particle or particles (e.g. corrosion particles) impact the sterile filter medium at a speed of 72 km/h. (30 m/sec correspond to a speed of 108 km/h)

(3) Recommendations Condensate Removal

- Condensate traps or drains in the housing should be installed upstream and downstream on the lowest points in the overall system.
- All piping must be installed in the flow direction at a slight slope (1-2%), so that steam condensate can collect into a condensate drain/trap by gravity.
- Filter housings must be installed vertically (with the housing opening facing down) so that the condensate cannot accumulate inside the housing/filter element.
- Filters must be installed at the top of tanks if they must be sterilised simultaneously with the tank.
- After a SIP process, as much steam as possible must be drained from the system to prevent the development of large quantities of condensate.
- The cooling of the filter elements according to a SIP process must be controlled so that these do not become 'blinded' by the condensate (especially important for hydrophobic gas filters).

and forms droplets.

from the pipe surface.

Condensate must be prevented in the entire system and removed immediately to prevent the risk of exploding valves

Liquid Filter Housings

Stainless Steel Housings for Liquids

PF-EG stainless steel housing (PF-EG Standard series and PF-EG Superplus series) have been developed for the filtration of liquids. In combination with various Donaldson code 7 filter car-

PF-EG housing

tridges all liquid filter housings can be used within different application areas. The standard series PF-EG Single consists of six different housing sizes for flow rates from 3 to 75 l/min – the series PF-EG Multiple of 17 housing sizes for flow rates of 150 to 3,000 l/min. Donaldson PF-EG Superplus filter housings (Single, clamp connection) are certified 3-A as standard.

Efficient Cleaning

Liquid Filter Connections

Connections

Donaldson also supplies elements with different types of adapters that fit into the housings of other manufacturers.

P2 226 O-rings bayonet 2 locking tabs flat end cap

P3 222 O-rings plug connection flat end cap

P7 226 O-rings bayonet 2 locking tabs locating fin

P8 222 O-rings plug connection locating fin

P9 222 O-rings bayonet 3 locking tabs locating fin

uf (ultrafilter) 226 O-rings plug connection flat end cap

Double open end with EPDM gaskets

Steam Sterilisation Instructions for Liquid Filters

Work Flow: Sterilisation Instructions for Liquid Filters in Flow Direction

(1) Open valves V4, V6, V7, V9 and V10.

(2) Drain the product from the filter system and associated piping. Opening valve V5 will aid this process.
(3) Open valve V1 and allow the steam condensate to drain until the steam trap below valve V3 closes. Close valve V9.

(4) Slowly open V3 allowing steam into the system: this will flow across the filters and through valve V4 and V5. This will allow the heating of the housing, the filters and associated piping without generating a significant differential pressure across the filters.
(5) When 'live' steam flows from valve V5 and T1 shows sterilisation temperature, close valve V5. This will direct the steam through the heated filter. Close valve V10.

(6) Observe the pressure gauges P1 and P2, control the steam flow rate at valve V3 and set the sterilisation steam pressure to approx. 300 mbar above the required saturated steam pressure (P1). (7) Ensure that the differential pressure betweenP1 and P2 does not exceed 0.2-0.3 bar g.

(8) When the steam trap below valve V6 closes, the steam pressure will begin to rise.

(9) Steam sterilise the cartridges for the time specified ensuring the conditions of temperature and pressure stay at a constant level.

(10) On completion of the Sterilisation-In-Place cycle, close V4, V6, V3 and V1 in that order.

(11) Slowly open V10 to release the steam pressure from the filter system and associated piping. When the pressure on P2 reads 0.1 bar g pressure close valve V10. Fully open valve V9 to release the remaining steam pressure from the filter system. When the pressure on P1 reads 0.1 bar g pressure, close valve V9.

Integrity Test Devices

Services by Donaldson

Donaldson offers a wide range of services around the different filter elements and their installation. There are various integrity test devices available, which are characterized by a quick and easy operation and can be purchased.

Membra-Check for Membrane Filters

The Membra-Check is used for the integrity measurement of membrane filters. In addition, unknown volumes can be measured or it can be used as a calibration measuring instrument for checking pressure transducers.

Filter Test Center (FTC) for Depth Filters

The integrity of depth filter elements is checked in the area of critical particle sizes via a test aerosol with the aid of the FTC.

Membra-Check

Filter Test Center (FTC)

Compressed Air Filtration · Filters for Sterile Air, Steam and Liquids · Refrigerant Drying · Adsorption Drying · Condensate Drains · Condensate Purification Systems · Process Air and Gas Processing

Total Filtration Management

Donaldson offers a wide variety of solutions to reduce your energy costs, improve your productivity, guarantee production quality and help protect the environment.

Total Filtration Service

A comprehensive range of services keeps your production at peak performance and at the lowest total cost of ownership.
