INSTALLATION, OPERATION & MAINTENANCE MANUAL

Replacement of filter elements
Gas Turbine Systems
Disclaimer

In case of any difficulties in assembling or erecting the Donaldson-supplied equipment, please contact the Donaldson project manager to agree on appropriate resolution. Donaldson will not be liable for extra expenses incurred unless this procedure has been followed. Refer to the contact information located below.

# TABLE OF CONTENTS

## IMPORTANT NOTES

2

## 1 ABOUT THIS MANUAL

8

1.1 Purpose ............................................................................................. 8
1.2 Target audience ................................................................................. 8
1.3 How to use this manual...................................................................... 8
1.4 Intended use...................................................................................... 9

## 2 SIGNAL WORD AND SIGN DEFINITIONS

10

2.1 Signal words .................................................................................... 10
2.2 Sign definitions ................................................................................ 10

## 3 INITIAL TASK

12

3.1 Cleaning and touch-up paint .......................................................... 12

## 4 SELF CLEANING FILTER ELEMENTS – GDX SYSTEM

13

4.1 Self-cleaning filter element - Quick lock type.................................... 14

4.1.1 Removal of old filter elements .............................................. 15
4.1.2 Installation of conical filter element on the tube sheet ......... 15

4.1.3 Installation of gasket washer on the cylindrical filter element .................................................................... 16

4.1.4 Installation of cylindrical filter element on the element support and conical filter element ................................. 17

4.1.5 Securing filter elements with clamp handle ............................. 18

4.2 Self-cleaning filter element – Retention nut type .............................. 20

4.2.1 Removal of old filter elements .............................................. 21
4.2.2 Installation of conical filter element on the tube sheet ......... 21

4.2.3 Installation of gasket washer on the cylindrical filter element .................................................................... 21

4.2.4 Installation of cylindrical filter element on the element support .................................................................... 22

4.2.5 Securing filter elements with retention nut ......................... 23

## 5 SELF CLEANING FILTER ELEMENT – TTD SYSTEM

24

5.1 Self-cleaning filter element – PowerSeal retention kit................. 26

5.1.1 Removal of old filter elements .............................................. 26
5.1.2 Installation of filter element on the element support.............. 27

5.1.3 Securing filter element with clamp handle ............................ 28

5.2 Self-cleaning filter element – Quick nut type .............................. 29

5.2.1 Removal of old filter elements .............................................. 29
5.2.2 Installation of crank element on the filter element ............. 30

5.2.3 Installation of filter element on the element support ............ 31

5.3 Self-cleaning filter element – Quick lock type (PHASED OUT) .... 32

5.3.1 Removal of old filter elements .............................................. 32
5.3.2 Installation of filter element on the element support .......... 33

5.3.3 Securing filter elements with clamp handle ......................... 34

## 6 STATIC FILTER ELEMENTS

35

6.1 Static filter element - Mini-pleat panel ......................................... 36
6.1.1 Removal of old filter elements .............................................. 37
6.1.2 Installation of new mini-pleat panel ................................. 37

6.2 Static filter element - Pocket filter .................................................... 38
6.2.1 Removal of pocket filter .......................................................... 38
6.2.2 Installation of pocket filter ..................................................... 39

6.3 Static filter element – Double conical type ....................................... 40
6.3.1 Removal of old filter elements .............................................. 41
6.3.2 Installation of large conical element on the tube sheet ......... 41
6.3.3 Installation of gasket washer on the small conical filter element ................................................................. 42
6.3.4 Installation of small conical filter element on the element support ................................................................. 43
6.3.5 Securing filter elements with retainer ................................... 43
6.3.6 Installation of the pre-filter pads ........................................... 45

7 SSC/NORRPAK FILTER ELEMENTS 47
7.1 SSC filter element ........................................................................... 48
7.1.1 Removal of old filter elements .............................................. 48
7.1.2 Installation of V-shaped filter element ................................. 49
7.1.3 Securing filter elements with retainer ................................... 49

LIST OF TABLES

Table 1: Revisions ................................................................................................ 2
Table 2: Orientation aids ...................................................................................... 8
1 ABOUT THIS MANUAL

These instructions are intended for qualified technical personnel only. Before beginning the work, you must carefully read and understand these instructions.

Anyone who will be performing tasks on this product must read this manual in order to:

- Reduce the risk of serious injury or death,
- Execute the tasks safely and correctly
- Keep task execution time to a minimum
- Increase the reliability and service life of the equipment

A copy of these instructions must be available to the person who does the work.

Safe operating practices and the environmental protection regulations applicable in the user’s country and at the site of implementation must always be strictly observed.

1.1 Purpose

The purpose of these instructions is to instruct qualified technical personnel in the safe installation of this filter element system.

You must carefully read and understand this document in order to:

- reduce the risk of injury or death
- execute the tasks correctly and
- increase the reliability and service life of the equipment.

1.2 Target audience

These instructions are written for qualified technical personnel concerned with the installation of this filter element system.

1.3 How to use this manual

Several orientation aids help to find specific information quickly:

<table>
<thead>
<tr>
<th>Element</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table of contents</td>
<td>Beginning of book</td>
</tr>
<tr>
<td>List of tables</td>
<td>Beginning of book</td>
</tr>
<tr>
<td>Running header and footer</td>
<td>Throughout the book</td>
</tr>
</tbody>
</table>

Table 2: Orientation aids
1.4 Intended use

The manual is intended to act as a standalone installation procedure for the filter elements.
2 SIGNAL WORD AND SIGN DEFINITIONS

The safety messages and signs used in this document represent the minimum requirements for the provision of safety and/or warning signs at work.

2.1 Signal words

**DANGER**
Indicates an imminent hazardous situation, which, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situation.

**WARNING**
Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

**CAUTION**
Indicates a potentially hazardous situation which, if not avoided, might result in minor or moderate injury.

2.2 Sign definitions

**Product packaging signs**
This type of sign indicates the product packaging. The below signs are used in this document and might also be seen in the workplace.

- ![This way up](image)
- ![Keep dry](image)
- ![Centre of gravity](image)
- ![Fragile](image)
- ![Sling here](image)

**Prohibition signs**
This type of sign indicates prohibited actions. The below signs are used in this document and might also be seen in the workplace.

- ![Do not stand here](image)
- ![No fire, open light, and smoking](image)
Personal protective equipment signs

This type of sign indicates the requirement to wear certain personal protective equipment. The below signs are used in this document and might also be seen in the workplace.

- Wear safety shoes
- Wear hardhat

Mandatory action signs

This type of sign indicates mandatory actions to avoid a hazard. The below signs are used in this document and might also be seen in the workplace.

- Mandatory instructions or other information that must be strictly observed.
- Mandatory to read instructions.

Information signs

- Information sign that points out generally important information to the user.
- Refer to information shown in the illustrated parts list.
- Damage to property that does not include injury to humans. If this warning is ignored, damage to equipment is possible.
3 INITIAL TASK

3.1 Cleaning and touch-up paint

- Thoroughly clean the equipment and surrounding area
- Touch-up paint and re-establish full corrosion protection measures
4 SELF CLEANING FILTER ELEMENTS – GDX SYSTEM

**WARNING**

**Compressed air**
Injury to personnel during maintenance
☞ Shut off the compressed air supply and bleed compressed air line before replacing filter elements.

**WARNING**

**Filter elements are flammable**
Injury to personnel and destruction of equipment
☞ No smoking or welding inside filter house

**CAUTION**

**Dust from filter elements**
Ingestion of dust particles
☞ Always wear facemask when replacing filter elements.

**CAUTION**

**Filter element support**
Injury to unprotected eyes
☞ Wear eye protection when replacing filter elements.

**Before servicing the filter elements**

1. Shut off the compressed air supply
2. Check that the compressed air line pressure level is zero
3. Shut off pulse-cleaning at control box

☞ All filter elements must be installed. Failure to do so will expose the turbine to potentially damaging dust particles.
☞ Use caution when installing the conical and cylindrical filter elements. Damage can result from the element support rod puncturing the filter element liner.
☞ It is not permitted to air-blast or clean and re-use Donaldson filters.
☞ Do not step on any of the air manifolds, air tubes, or element yokes inside the filter module, damage will be the result.

☞ Use only Donaldson Filter Elements for replacement.
☞ Damage to the turbine due to the use of elements other than Donaldson invalidates the Donaldson warranty.
☞ Warranty is invalidated after 5 years after date of production.

**Replacement of filter elements**

Manual             Manual-en     13 of 50

Figure 1: Self-cleaning filter elements in final position – GDX system

Figure 2: Filter element assembly – Quick lock type
Caution when installing the filter elements; Damage can result by the front end of the element supports puncturing into the filter element’s liner as shown in Fig.3. Position the filter elements with their gasket facing upward to avoid ripping the gasket on the platform grating. Do not step on air manifold, tubing or filter element supports inside the filter modules; damage will result.

![Figure 3: Caution when installing the filter element](image)

4.1.1 Removal of old filter elements

1. Brush or vacuum clean any dust which could have accumulated over the elements at the tube sheet level and at any other location where it might fall off while changing the elements. Start doing this from the top row of elements. This is to reduce clean air side contamination.
2. Lift up and remove clamp handle (fig.2, items 6) and gasket washer (fig.2, items 5). Do not use any tools to remove the gasket washer from the cylindrical filter element.
3. Remove cylindrical and conical filter elements (fig.2, items 3 & 2) from filter house.
4. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.

Keep clamp handle and gasket washer safe; they will be reused. Carefully inspect the gasket washer for any damages and replace as necessary.

4.1.2 Installation of conical filter element on the tube sheet

- Element support yokes are designed to withstand a maximum load of 35kg. The yokes must not be used as a ladder to install the filter elements
- Make sure that the element support legs are centered on the tube sheet hole and aligned with each other to ensure proper sealing between the elements and with the tube sheet (filter support frame).
1. See figures 2 & 4
2. Slide (one) conical filter element (fig.2 item 2) onto the element support kit (fig.2 item 4) until the gasket at the large end touches the tube sheet (fig.2 item 1).

![Figure 4: Installation of conical filter element.](image)

**4.1.3 Installation of gasket washer on the cylindrical filter element**

1. See figure 5

![Figure 5: Installation of gasket washer on cylindrical filter element](image)

2. Place gasket washer (fig.2 item 5) in the hole on the end of the cylindrical filter element (fig.2 item 3).

![Warning](image)

The gasket washer must be placed correctly in the cylindrical filter element; otherwise, the system will not be airtight. See figures 6 & 7
4.1.4 **Installation of cylindrical filter element on the element support and conical filter element**

1. See figure 8

![Figure 8: Installation of cylindrical filter element on conical filter element](image)

2. Slide (one) cylindrical filter element (fig.2 item 3) + gasket washer (fig.2 item 5) onto the element support (fig.2 item 4) and against the conical filter element (fig.2 item 2)

3. See figures 9 & 10.

4. Push both elements tight against the tube sheet until the element support (fig.2 item 4) protrudes through the gasket washer (fig.2 item 5).

Ensure that gasket washer is still properly seated in the metal cap of the cylindrical filter element, as shown in fig.9.
4.1.5 Securing filter elements with clamp handle

1. See figures 11 & 12
2. Attach the clamp handle (fig.2 item 6) to the element support (fig.2 item 4)

3. Secure the filter elements by pushing down the clamp handle (fig.2 item 6).

**CAUTION**

Pushing clamp handle too far
Fingers could be injured and/or gasket washer could be damaged

- Do not push clamp handle beyond position shown in figures 13 & 14.
- The flat edges of the clamp handle must be flush with gasket washer metal surface as shown in figure 14.
4. **Warning**: If it is very difficult or impossible to close the clamp handle, then the installation personnel must re-check all stages of the element installation process and, if necessary, dismantle the element assembly and redo the procedure.

4. The installer shall rotate the handle downwards until the element support rod reaches the built-in mechanical stop of the handle, as shown in fig. 14. Figures 13 & 14 show the final position of the clamp handle.

5. Repeat sections 4.1.1 to 4.1.5 for all other filter elements.

- **Result**: filter elements are installed
4.2 Self-cleaning filter element – Retention nut type

Position the filter elements with their gasket facing upward to avoid ripping the gasket on the platform grating.

Caution when installing the filter elements; Damage can result by the front end of the element supports puncturing into the filter element’s liner as shown in Fig. 16

Do not step on air manifold, tubing or filter element supports inside the filter modules; damage will result.

Inspect the threaded retention bolt (fig 15 item 7) for any damage and replace as necessary.
4.2.1 Removal of old filter elements

1. Brush or vacuum clean any dust which could have accumulated over the elements at the tube sheet level and at any other location where it might fall off while changing the elements. Start doing this from the top row of elements; this is to reduce clean air side contamination.
2. Remove retention nut (fig.15, items 6) and gasket washer (fig.15, items 5).
3. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.

4.2.2 Installation of conical filter element on the tube sheet

Element support yokes are designed to with stand only a maximum load of 35kg. The yokes must not be used as a ladder to install the filter elements. Make sure that the element retention yokes are centered on the tube sheet hole and aligned with each other to ensure proper sealing between the elements and with the tube sheet (filter support frame).

1. See figures 15 & 17
2. Slide (one) conical filter element (fig.15 item 2) onto the element support (fig.15 item 4) until the gasket at the large end touches the tube sheet (fig.15 item 1).

Figure 17: Installation of conical filter element.

4.2.3 Installation of gasket washer on the cylindrical filter element

1. See fig.18

Figure 18: Installation of gasket washer on cylindrical filter element
2. Place gasket washer (fig.15 item 5) in the hole to the end of the cylindrical filter element (fig.15 item 3).

The gasket washer must be placed correctly in the cylindrical filter element; otherwise, the system will not be airtight. See figure 19

![Figure 19: Sectional view – when gasket fitted correctly](image)

**4.2.4 Installation of cylindrical filter element on the element support**

1. See fig.20

![Figure 20: Installation of cylindrical filter element on conical filter element](image)

2. Slide (one) cylindrical filter element (fig.15 item 3) + gasket washer (fig.15 item 5) onto the element support (fig.15 item 4) and against the conical filter element (fig.15 item 2).

3. Push both elements tight against the tube sheet until the element support (fig.15 item 4) protrudes through the gasket washer (fig.15 item 5).

Ensure that gasket washer is still properly seated in the metal cap of the cylindrical filter element, as shown in fig.20
4.2.5 Securing filter elements with retention nut

1. See fig. 15 and fig. 21.
2. Screw the retention nut (fig 15 item 6) to the threaded retention bolt on element support against the gasket washer as shown in Figure 21.

![Retention bolt and retention nut](image)

*Figure 21: Assembly of retention nut*

**CAUTION**

**Over tightening of the retention nut**

Element support and/or gasket washer could be damaged

Torque on the element retention nut should be 18-20 Nm to ensure an airtight seal. Do not exceed 20 Nm torque on the element retention nut. Over-tightening can damage the filter elements.

If it is very difficult or impossible to tighten the retention nut, then the installation personnel must re-check all stages of the element installation process and, if necessary, dismantle the element assembly and redo the procedure.

3. Repeat sections 4.2.1 to 4.2.5 for all other filter elements.

- **Result:** filter element is installed
5 SELF CLEANING FILTER ELEMENT – TTD SYSTEM

**WARNING**

Compressed air
Injury to personnel during maintenance
❖ Shut off the compressed air supply and bleed compressed air line before replacing filter elements.

**WARNING**

Filter elements are flammable
Injury to personnel and destruction of equipment
❖ No smoking or welding inside filter house

**CAUTION**

Dust from filter elements
Ingestion of dust particles
❖ Always wear facemask when replacing filter elements.

**CAUTION**

Filter element support
Injury to unprotected eyes
❖ Wear eye protection when replacing filter elements.

Before servicing the filter elements

1. Shut off the compressed air supply
2. Check that the compressed air line pressure level is zero
3. Shut off pulse-cleaning at control box

❖ All filter elements must be installed. Failure to do so will expose the turbine to potentially damaging dust particles.
❖ It is not permitted to air-blast or clean and re-use Donaldson filters.

❖ Use only Donaldson Filter Elements for replacement.
❖ Damage to the turbine due to the use of elements other than Donaldson invalidates the Donaldson warranty.
❖ Warranty is invalidated after 5 years.

Figure 23: Filter element assembly – PowerSeal type

5.1.1 Removal of old filter elements

1. Care must be taken when removing the QLY handle (fig. 23, item 5). Make sure the element is not falling off.

   ![Warning Icon]
   Keep clamp handle; they will be reused.

2. Carefully remove filter element (fig. 23, item 4) from filter house.
3. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.
5.1.2  Installation of filter element on the element support

1. See figure 24

2. Slide (one) filter element (fig.23 item 4) onto the retention rod (fig.23 item 3).
3. Push element onto the seal tube (fig.23 item 2) until the retention rod (fig.23 item 3) protrudes through the filter element (fig.23 item 4).

Figure 24: Installation of filter element on element support
Securing filter element with clamp handle

1. See figure 25 & 26
2. Attach the clamp handle (fig.23 item 5) to the retention rod (fig.23 item 3).

Figure 25: Positioning of clamp handle
Figure 26: Secure filter elements using clamp handle

CAUTION

Pushing clamp handle too far
Fingers could be injured and/or gasket washer could be damaged

- Do not push clamp handle beyond position shown in figures 25 & 26.
- The flat edges of the clamp handle must be flush with gasket washer metal surface as shown in figure 26.

3. Secure the filter elements by pushing down the clamp handle (fig.23 item 5).

If it is very difficult or impossible to close the clamp handle, then the installation personnel must re-check all stages of the element installation process and, if necessary, dismantle the element assembly and redo the procedure.

4. Figure 26 shows the correct final position of the clamp handle. It is normal that clamp handles will not be oriented in the same direction.
5. Repeat sections 5.1.1 to 5.1.3 for all other filter elements.

- Result: filter element is installed
5.2 Self-cleaning filter element – Quick nut type

<table>
<thead>
<tr>
<th>Pos.</th>
<th>Designation</th>

</tr>
<tr>
<td>3</td>
<td>Quick nut</td>
<td>6</td>
<td>Crank</td>
</tr>
</tbody>
</table>

Figure 27: Filter element assembly – Crank type

5.2.1 Removal of old filter elements

1. Grasp the crank and turn counterclockwise until the filter is hanging away from the tube sheet two or three inches.
2. Continue to turn the crank until the filter assembly is released from the quick-nut or lift the assembly up and then down to release the crank form the quick-nut. Both methods can be used to remove the assembly.
3. Retain the crank for the installation of the replacement filter.
### 5.2.2 Installation of crank element on the filter element

4. See figure 28

5. Insert the crank (fig.27 item 6) through the filter element (fig.27 item 4)
6. Push the crank as far into the filter element as possible. The crank and element will be installed together.
5.2.3 Installation of filter element on the element support

1. See figure 29

![Figure 29: Installation of crank element on the filter element](image)

2. With one person supporting the filter element (fig.27 item 4) and another operating the crank (fig.27 item 6): insert the crank rod end that is protruding from the filter element into the centre of the quick-nut (fig.27 item 3) and push the crank and element assy upward as far as it will go, the quick-nut assembly will close upon the crank threads.

If the quick nut does not close upon the crank properly, the person installing the element will still support the total weight of the assembly. If it is still supported only by the person installing the element, perform the above procedure until the quick nut engages the crank threads.

3. Centre the filter element over the collar (fig.27 item 2) and turn the crank handle clockwise (about two to three turns) until the element is drawn tight against the tube sheet. The crank is to be firmly tightened by hand so that the element gasket compresses against the tube sheet. There is no specific torque requirement.

4. Repeat sections 5.2.1 to 5.2.3 for all other filter elements.

- Check that element is properly seated and secured by firmly grasping the element and turning it around its axis
- If the element can still be rotated by hand around its axis, tighten the crank further to ensure airtight integrity at the gasket/tube sheet connection.
- The screws retaining the collar on the tube sheet acts as gasket stops to ensure that the gasket is not over compressed.

- **Result:** filter element is installed
5.3 Self-cleaning filter element – Quick lock type

Figure 30: Filter element assembly - quick lock type

5.3.1 Removal of old filter elements

1. Care must be taken when removing the QLY handle (fig. 30, item 5). Make sure the element is not falling off.

   Keep clamp handle safe; they will be reused.

2. Carefully remove filter element (fig. 30, item 2) from filter house.
3. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.
5.3.2 Installation of filter element on the element support

1. See figure 31

![Figure 31](image)

Figure 31: Installation of filter element on element support

2. Lift the filter element (fig.30 item 2) + gasket washer (fig.30 item 4) onto the element support (fig.30 item 3).

3. Push the filter element tight against the tube sheet until the element support (fig.30 item 3) protrudes through the gasket washer (fig.30 item 4).

4. See figures 32 & 33.

Ensure that gasket washer is still properly seated in the metal cap of the filter element, as shown in fig.33.

![Figure 32](image)  ![Figure 33](image)

Figure 32: Correct position of gasket washer  Figure 33: Incorrect position of gasket washer
5.3.3 Securing filter elements with clamp handle

1. See figures 34 & 35
2. Attach the clamp handle (fig.30 item 5) to the element support (fig.30 item 3)

![Figure 34: Positioning of clamp handle](image1) ![Figure 35: Secure filter elements using clamp handle](image2)

3. Secure the filter elements by pushing down the clamp handle (fig.30 item 5).

   Do not use any tools to force the clamp handle into position. If it is very difficult or impossible to close the clamp handle by hand, then the installation personnel must re-check all stages of the element installation process and, if necessary, dismantle the element assembly and redo the procedure.

4. Figures 36 & 37 show the correct final position of the clamp handle. It is possible that not all clamp handles be orientated in the same direction.
5. Repeat sections 5.3.1 to 5.3.3 for all other filter elements.

![Figure 36: Clamp handle final position (view 1)](image3) ![Figure 37: Clamp handle final position (view 2)](image4)

- **Result:** filter elements are installed
6 STATIC FILTER ELEMENTS

⚠️ WARNING

Filter elements are flammable
Injury to personnel and destruction of equipment
- No smoking or welding inside filter house

⚠️ CAUTION

Dust from filter elements
Ingestion of dust particles
- Always wear facemask when replacing filter elements.

- The static filter elements contain fragile media and must be handled very carefully
- Inspect all elements (before installation) for any holes in the media. Any damaged elements must be replaced to prevent dirty air getting into the clean airside
- All filter elements must be installed. Failure to do so will expose the turbine to potentially damaging dust particles
- It is not permitted to air-blast or clean and re-use Donaldson filters

- Use only Donaldson Filter Elements for replacement.
- Damage to the turbine due to the use of elements other than Donaldson invalidates the Donaldson warranty.
- Warranty is invalidated after 5 years.
6.1 Static filter element - Mini-pleat panel

Figure 38: Filter element assembly

Figure 39: Filter element mini-pleat filter
6.1.1 Removal of old filter elements

1. See figures 38 and 40.
2. Turn the clamps x4 (fig.38 item 1) into open position (fig. 40). The filter element is now detached from the tube sheet.
3. Remove the filter element (fig.39) from the tube sheet.
4. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.

6.1.2 Installation of new mini-pleat panel

1. See figures 38 and 40.
2. With clamps x4 (fig.38 item 1) in open position (fig. 40), insert mini-pleat panel into tube sheet until its gasket touches tube sheet.

Do not compress the gasket more than 50%. If the gasket is compressed too much it will be damaged.

3. Turn the clamps (x4) (fig.38 item 1) into the closed position (fig. 40).
4. Repeat sections 6.1.1 to 6.1.2 for all other filter elements.

- **Result:** Mini pleat panel is installed
6.2 Static filter element - Pocket filter

![Pocket filter](image)

Figure 41: Pocket filter

- **Always** have all pocket filters installed. Failure to do so will compromise the level of cleanliness of the downstream filter side, thereby affecting the final filter and gas turbine performance.
- **Always** check the pocket filters before installing them. Reject any damaged pocket filters.
- **Always** make sure the Clean Air Side is clean before installing the pocket filters.

The schedule for change-out of pocket filters is dependent on:
- Site conditions
- $\Delta p$ specified by customer
- Visible dirt on filters

Donaldson recommends filter replacement after 2 years of operation. The filter life is limited to five years: 3 years storage in a dry and well-ventilated area in their sealed original box and 2 years in operation.

- **When** filters are used for the first time, perform regular checks to establish when, approximately, they should be changed.
- **Donaldson** recommends, for maximum turbine protection, to replace the pocket elements while the turbine is at a standstill.

6.2.1 Removal of pocket filter

1. **Brush** or vacuum clean the dust which could have accumulated over the elements at the tube sheet level and at any other location where it might fall out while changing the elements. Start doing this from the top row of elements; this is to reduce clean air side contamination.
2. **Undo** the retention device and remove pocket filters from the tube sheet.
3. **Discard** the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.
6.2.2 Installation of pocket filter

1. See figure 41.
2. Position pocket filter on the tube sheet until its header touches tube sheet.
3. Fix the pocket filter by securing it with the supplied retention device.

Note that this fixation method varies dependent on design/specs of the air filter.

4. Thoroughly check that the pocket filters are fitted tightly against the tube sheet and secured.
5. Repeat sections 6.2.1 to 6.2.2 for all other filter elements.

- **Result:** pocket filter is installed
6.3 Static filter element – Double conical type

<table>

</tr>
</tbody>
</table>

Figure 42: Yoke legs and filter element alignment

**Caution** when installing the filter elements; Damage can result by the front end of the element supports puncturing into the filter element’s liner as shown in Fig. 42 Position the filter elements with their gasket facing upward to avoid ripping the gasket on the platform grating.

Do not step on air manifold, tubing or filter element supports inside the filter modules; damage will result.

Always use the gasket washer (fig. 42 item 5) and the retention nut (fig. 42 item 6) that comes with the supplied filter element.

Figure 43: Assembly of retention nut
6.3.1 Removal of old filter elements

1. Brush or vacuum clean any dust which could have accumulated over the elements at the tube sheet level and at any other location where it might fall off while changing the elements. Start doing this from the top row of elements; this is to reduce clean air side contamination.
2. Remove retention nut (fig.42, items 6) and gasket washer (fig.42, items 5).
3. Discard the removed filter elements by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.

6.3.2 Installation of large conical element on the tube sheet

Element support yokes are designed to stand only a maximum load of 35kg. The yokes must not be used as a ladder to install the filter elements. Make sure that the element retention yokes are centered on the tube sheet hole and aligned with each other to ensure proper sealing between the elements and with the tube sheet (filter support frame).

1. See figure 42 and 44.
2. Slide the large conical filter element (fig.42 item 2) onto the element support (fig.42 item 4) until the gasket at the large end touches the tube sheet (fig.42 item 1).

Figure 44: Installation of large conical filter element.
6.3.3 Installation of gasket washer on the small conical filter element

1. See figure 45.

2. Place gasket washer (fig.42 item 5) in the hole at the end of the small conical filter element (fig.42 item 3).

The gasket washer must be placed correctly in the cylindrical filter element; otherwise, the system will not be airtight. See figure 46.

---

Figure 45: Installation of gasket washer.

Figure 46: Sectional View – when gasket fitted correctly.
6.3.4 Installation of small conical filter element on the element support

1. See figure 47

![Figure 47: Installation of small conical filter element on element support](image)

2. Slide the small conical filter element (fig.42 item 3) + gasket washer (fig.42 item 5) onto the element support (fig.42 item 4) and against the large conical filter element (fig.42 item 2).

3. Push both elements tight against the tube sheet until the element support (fig.38 item 4) protrudes through the gasket washer (fig.42 item 5).

Ensure that gasket washer is still properly seated in the metal cap of the cylindrical filter element, as shown in fig.48

6.3.5 Securing filter elements with retention nut

1. See figures 42 & 48

2. Screw the retention nut (fig.42 item 6) to the threaded retention bolt on yoke against the gasket washer as shown in Fig. 48.

![Figure 48: Assembly of retention nut](image)
**CAUTION**

**Over tightening of the retention nut**

Element support and/or gasket washer could be damaged

Torque on the element retention nut should be 18-20 Nm to ensure an airtight seal. Do not exceed 20 Nm torque on the element retention nut. Over-tightening can damage the filter elements.

Verify that the small and large conical elements are correctly aligned with each other. Correct alignment is critical for proper air sealing. See fig.49

If it is very difficult or impossible to tighten the retention nut, then the installation personnel must re-check all stages of the element installation process and, if necessary, dismantle the element assembly and redo the procedure.

---

Check the alignment between large and small filter elements. Correctly aligned filter elements are critical for proper air sealing.

---

Figure 49: Correct alignment of large and small filter elements
6.3.6 Installation of the pre-filter pads

Figure 50: Correct alignment of large and small filter elements
This section describes the installation of the pre-filter pads on the conical filter elements. The pre-filter pads are composed of 2 pieces: a large and a small pad. 

1. See figure 50.
2. Slide the large pre-filter cone over the large conical filter element. Ensure it is well positioned near the tube sheet. Completely cover the large conical filter element with the large pre-filter cone.
3. Slide the small pre-filter cone over the small conical filter element. Ensure it overlaps over the large pre-filter cone; push it over, until the small end is squeezed firm over the element cover.
4. Keep the pre-filters clean during installation.
5. Repeat sections 6.3.1 to 6.3.6 for all other filter elements.

- **Result:** filter element + pre-filter pads are installed
WARNING
Compressed air
Injury to personnel during maintenance
 Shut off the compressed air supply and bleed compressed air line before replacing filter elements.

WARNING
Filter elements are flammable
Injury to personnel and destruction of equipment
 No smoking or welding inside filter house

CAUTION
Dust from filter elements
Ingestion of dust particles
 Always wear facemask when replacing filter elements.

CAUTION
Filter element support
Injury to unprotected eyes
 Wear eye protection when replacing filter elements.

Before servicing the filter elements
1. Shut off the compressed air supply
2. Check that the compressed air line pressure level is zero
3. Shut off pulse-cleaning at control box

 All filter elements must be installed. Failure to do so will expose the turbine to potentially damaging dust particles.
 Use caution when installing the conical and cylindrical filter elements. Damage can result from the element support rod puncturing the filter element liner.
 It is not permitted to air-blast or clean and re-use Donaldson filters.
 Do not step on any of the air manifolds, air tubes, or element yokes inside the filter module, damage will be the result.

 Use only Donaldson Filter Elements for replacement.
 Damage to the turbine due to the use of elements other than Donaldson invalidates the Donaldson warranty.
 Warranty is invalidated after 5 years after date of production.
7.1  SSC filter element

7.1.1  Removal of old filter elements

1. See fig. 51
2. Brush or vacuum clean any dust which could have accumulated over the elements at the tube sheet level and at any other location where it might fall off while changing the elements. Start doing this from the top row of elements. This is to reduce clean air side contamination.
3. Loosen up the bolt and nuts (item 3) and remove retainer end (item 5) followed by the retainer middle (item 4) on the bottom part of the filter, do this on the remaining retainer (up and bottom).
4. Discard the removed filter elements (item 2) by utilizing a drop chute directed to a dumpster or by lowering a filter basket or even by hand; do not disperse the dust inside the filter house and working area.
7.1.2 Installation of V-shaped filter element

1. See figures 51 and 52

2. Slide (one) V-shaped filter element (fig. 51 item 2) onto the element support (fig. 51 item 1) until the gasket at the large end touches the tube sheet.

7.1.3 Securing filter elements with retainer

Figure 52: Installation of V-shaped filter element

Figure 53: Positioning of retainer
1. See Figures 51 and 53.
2. Place and fix retainer end (fig. 51 item 5) onto the filter element (fig. 51 item 2) followed by the retainer middle (fig. 51 item 4).

If it is very difficult or impossible to close the retainer, then the installation personnel must re-check all stages of the element installation process and if necessary, dismantle the element assembly and redo the procedure.

3. Figures 54 & 55 show the correct final position of the retainer.
4. Repeat sections 6.3.1 to 6.3.6 for all other filter elements.

- **Result:** All filter elements installed
